

Lab Calibration of Hyperspectral Radiometer and Field Measurements

Kristine Pinky Dulaca

Mentors: Xi Shao, Changyong Cao

Objectives

- Operate optical spectrometer to collect reflectance data using a certified reflectance standard
- Analyze reflectance data across different natural and man-made samples, and identify sources of error during laboratory and field measurements
- Prepare hyperspectral field measurements to support satellite sensor calibration

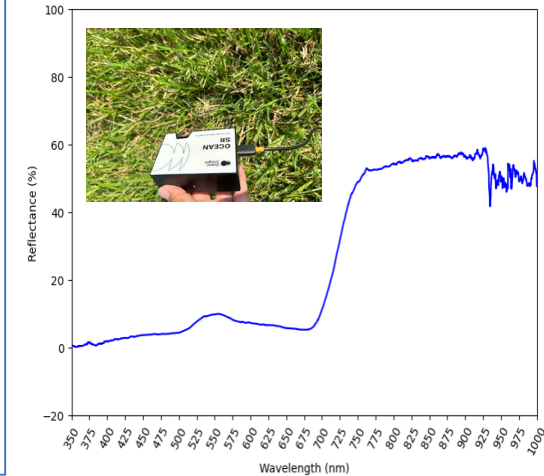

Results

- Set up and carry out lab calibration of miniature hyperspectral radiometer
- Field measurements of hyperspectral measurements of different ground targets
- Developed python modules for data visualization and analysis

Equipment and Setup

Spectral reflectance of Grass from field measurement

Reflectance Measurement with Hyperspectral Radiometer

Ocean Insight
Miniature Spectrometer
SR-2XR250-25
(200 to 1100 nm, 1.7 nm resolution)

D_λ – Example Dark Spectrum

R_λ – Reference Solar Diffuser Spectrum (Uncalibrated)

$$T(\%) = \frac{S_\lambda - D_\lambda}{R_\lambda - D_\lambda} \times 100$$

Where:

T = Sample Reflectance (%)

S_λ = Sample intensity at wavelength λ

D_λ = Background intensity at wavelength λ

R_λ = Reference intensity at wavelength λ

Spectrometer Measurement Analysis of Different Ground Targets

Grass

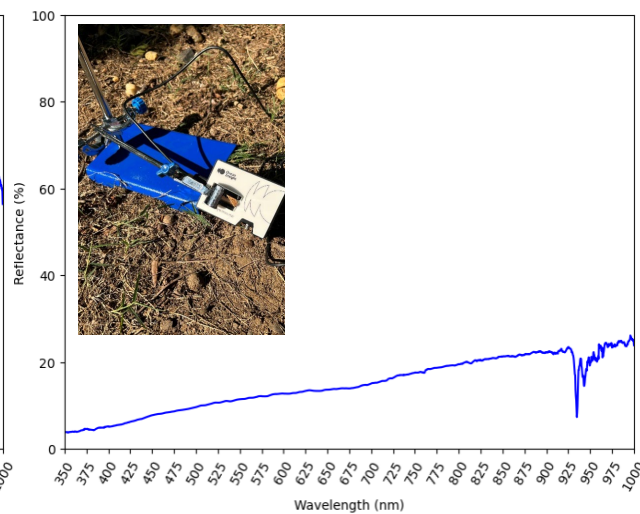

Soil

Concrete

Asphalt
